Intelligence Quotient Evaluation

Name: Adam Cheong
Date of Birth: 04/17/2009
Age at Testing: 13 years, 2 months
Evaluation Date: 06/24/2022
Report Date: 06/27/2022
Examiner: Jenny Forman, Ph.D.

Identifying Information and Reason for Referral:

Adam is a 13-year-old boy who will be entering the 8th grade at Woodland School in Portola Valley, California this fall. He was referred by his parents for an IQ test for private school admissions.

Evaluation Procedure:

Wechsler Intelligence Scale for Children, 5th Edition - Integrated (WISC-V)

Behavioral Observations:

Adam was given one testing session that lasted approximately 1 hour and 35 minutes with a 10-minute break mid-testing. His appearance was adequately groomed, his eye contact was spontaneous, and his speech was clear and fluent. His demeanor was cooperative and sweet, and his mood appeared neutral. Because the testing occurred during Covid-19, he and this examiner wore masks.

Adam's motor activity was calm throughout the testing. His attention and concentration skills appeared very good, and he did not need directions repeated, although he occasionally asked clarifying questions about the timed subtests. His effort and motivation appeared good and, therefore, the present testing appears to be an adequate indication of his abilities at this time.

Evaluation Findings:

Intellectual Functioning:

The WISC-V was administered to assess Adam's verbal and nonverbal intellectual abilities. His overall intellectual functioning fell in the Extremely High range with a Full-Scale IQ of 135, greater than 99 percent of his same-aged peers. The Full-Scale IQ is calculated using the Verbal Comprehension, Visual Spatial, and Fluid Reasoning indexes, along with the Digit Span and Coding tasks.

In the Verbal Comprehension Index, Adam scored in the Extremely High range with a standard score of 136 in the 99th percentile. This section measured his retrieval of information, understanding of abstract verbal concepts, and communication of knowledge. Both tasks were administered to him verbally and he had to answer verbally.

On the Similarities task (16) he was asked to describe how two words were alike. On the Vocabulary task (17) he had to provide the definitions of words.

In the Visual Spatial Index, Adam scored in the Average range with a standard score of 108 in the 70th percentile. This section measured his ability to attend to visual details and understand visual-spatial relationships by constructing geometric designs from a model. It also measured visual-motor coordination and knowledge of part-whole relationships. On the Block Design task (13) he had to quickly assemble blocks to replicate a two-dimensional pictured design, and on the Visual Puzzles task (10) he was asked to choose three pictures from a group that fit together to make the completed picture shown.

Adam's score in the Fluid Reasoning Index fell in the Extremely High range with a standard score of 140, greater than 99.6 percent of his same-aged peers. This section measured his ability to detect the underlying conceptual relationship among visual objects and to use reason to identify and apply rules. It involved inductive and quantitative reasoning, abstract thinking, and simultaneous processing. On the Matrix Reasoning task (17) he was required to choose the design that best completed a gridded pattern, and on the Figure Weights task (17) he was asked to choose the design of the missing weight(s) to balance a scale.

Adam's score in the Working Memory Index fell in the High Average range with a standard score of 115 in the 84th percentile. This section measured visual and verbal short-term memory, attention and concentration, and ability to hold information in his awareness while manipulating numbers. On Digit Span (14) he was asked to repeat a sequence of numbers forward, backward, and in ascending order. He was able to repeat up to 8 numbers forward, 5 numbers backward, and 8 numbers in ascending order. On Picture Span (11) he was required to put in order a sequence of pictures that he viewed on the previous page.

In the Processing Speed Index, Adam's standard score was 123 in the Very High range and 94th percentile. This section measured his perceptual-visual-motor skills and ability to process nonlinguistic visual symbols rapidly. Both tasks in this domain were timed for 120 seconds and included Coding (11) in which he had to quickly write symbols underneath their corresponding numbers and Symbol Search (17) in which he had to quickly search for symbols in a group and mark the correct match or mark "no."

The Quantitative Reasoning Index is an ancillary index that measures one's capacity to perform mental math operations and comprehend abstract relationships. Adam's standard score was 149 in the Extremely High range and 99.9th percentile. The section is comprised of Figure Weights (17; see Fluid Reasoning Section) and Arithmetic (19) in which he was required to solve math word problems that were read to him without using pencil and paper.
